#### Product description

The John Cooper Works front axle sport brake for the MINI improves thermal capacity, brake power and wet braking response. This is achieved by the larger internally ventilated, perforated and grooved brake discs as well as an enlarged brake piston diameter and sport brake pads.

The response of the John Cooper Works sport brake has considerably more bite and gives the driver a direct pedal feel. Compared to the series brake, this provides greater deceleration with the same pedal force.

To distinguish the sport brake from the series brake, the brake casings are finished in red and are visibly marked with the John Cooper Works logo.

#### Sales features / benefits

- The John Cooper Works sport brake was designed and developed by Mike Cooper in conjunction with BMW Group brake specialists and has been tested and approved on the basis of internal requirements.
- The sport brake gives the sporty driver additional safety, particularly when the brake is subjected to high thermal stress.
- The sporting properties suffer hardly any deterioration in comfort compared to the series brake, such as noise, more difficult control or greater wear.

#### Note

They must be installed as described in the special John Cooper Works installation instructions. The car must be run-in carefully during the first 200 km after installation of the sport brake! The full effectiveness of the sport brake is provided thereafter. Please ensure that you pass this information on to the customer. Please refer to the details of the permitted wheel dimensions in the EPC and give the enclosed customer information to the customer. ◀
